Paediatric urology for the adult urologist. Congenital disorders of the external genitalia, DSD and longterm outcome
ESU Course 11

Location: Orange Area, Room 2 (Level 0)
Chair: G. Bogaert, Leuven (BE)

Aims and objectives of this session
Congenital anomalies of the external genitalia are an important topic for the urologist and paediatric urologist. A child born with a disorder of sexual differentiation is a physical and psychological emergency. It requires the knowledge of the pathophysiology of the most frequent causes and the subsequent diagnostic and treatment decision tree. Together with a team of paediatricians, psychologists, geneticists, the (paediatric) urologist must be able to explain the condition to the parents in a way that they can choose the best option for their child. The external genitalia of a child will evolve from a social and voiding tool to an erotic and reproduction tool during puberty and adolescence. Again, the (paediatric) urologist should be aware of possible problems and accompany the child and their parents during that process.

After this course, the attendant will be able:
• to identify the most common causes of sexual differentiation (DSD) and know how to handle in the neonatal period.
• to diagnose and how to treat the most common congenital and acquired problems of the external genitalia.
• the normal development of the sexual function and fertility during puberty and adolescence, as well as possible problems due to congenital or acquired pathology.

Disorders of sex development
C. Radmayr, Innsbruck (AT)

Congenital malformations of the external genitalia: What do we need to know regarding sexual function and fertility in adolescence and adulthood?
G. Bogaert, Leuven (BE)

Congenital and acquired pathology of the external genitalia
